

# Style guide

## File Structure

- Follow the folder structure that has been set up, refrain from adding new folders unless absolutely necessary
- Pages go in the pages folder. Helper components for the pages go in their respective components folder.
- All react js files should be uppercase.
- use js instead of jsx

## CSS

- we will use CSS modules <https://programmingwithmosh.com/react/css-modules-react/> to resolve the css conflicts issue
- use flexbox for layout. avoid % or using floats.
- use bootstrap components where humanly possible (buttons, text fields, dropdowns, containers etc.)
- use bootstrap utils where possible for padding. if you must use css, do not use px. use % or rem instead.
- do not apply CSS directly to elements e.g. (button, text field). Create a class instead: `<button class="xyz">` and apply the styles to that class
